Creating a keras model

Model building steps

- Specify Architecture
- Compile
- Fit
- Predict

Model specification

```
In [1]: import numpy as np

In [2]: from keras.layers import Dense

In [3]: from keras.models import Sequential

In [4]: predictors = np.loadtxt('predictors_data.csv', delimiter=',')

In [5]: n_cols = predictors.shape[1]

In [6]: model = Sequential()

In [7]: model.add(Dense(100, activation='relu', input_shape = (n_cols,)))

In [8]: model.add(Dense(100, activation='relu'))

In [9]: model.add(Dense(1))
```

Let's practice!

Compiling and fitting a model

Why you need to compile your model

- Specify the optimizer
    - Many options and mathematically complex
    - “Adam” is usually a good choice
- Loss function
    - “mean_squared_error” common for regression

Compiling a model

```
In [1]: n_cols = predictors.shape[1]

In [2]: model = Sequential()

In [3]: model.add(Dense(100, activation='relu', input_shape=(n_cols,)))

In [4]: model.add(Dense(100, activation='relu'))

In [5]: model.add(Dense(1))

In [6]: model.compile(optimizer='adam', loss='mean_squared_error')
```

What is fitting a model

- Applying backpropagation and gradient descent with your data to update the weights
- Scaling data before fitting can ease optimization

Fitting a model

```
In [1]: n_cols = predictors.shape[1]

In [2]: model = Sequential()

In [3]: model.add(Dense(100, activation='relu', input_shape=(n_cols,)))

In [4]: model.add(Dense(100, activation='relu'))

In [5]: model.add(Dense(1))

In [6]: model.compile(optimizer='adam', loss='mean_squared_error')

In [7]: model.fit(predictors, target)
```

Let's practice!

Classification models

Classification

- 'categorical_crossentropy' loss function
- Similar to log loss: Lower is better
- Add metrics = ['accuracy'] to compile step for easy-to-understand diagnostics
- Output layer has separate node for each possible outcome, and uses 'softmax' activation

Quick look at the data

shot_clock	dribbles	touch_time	shot_dis	close_def_dis	shot_result
10.8	2	1.9	7.7	1.3	1
3.4	0	0.8	28.2	6.1	0
0	3	2.7	10.1	0.9	0
10.3	2	1.9	17.2	3.4	0

Transforming to categorical

shot_result
1
0
0
0

→

Outcome 0	Outcome 1
0	1
1	0
1	0
1	0

Classification

```
In[1]: from keras.utils import to_categorical

In[2]: data = pd.read_csv('basketball_shot_log.csv')

In[3]: predictors = data.drop(['shot_result'], axis=1).as_matrix()

In[4]: target = to_categorical(data.shot_result)

In[5]: model = Sequential()

In[6]: model.add(Dense(100, activation='relu', input_shape = (n_cols,)))

In[7]: model.add(Dense(100, activation='relu'))

In[8]: model.add(Dense(100, activation='relu'))

In[9]: model.add(Dense(2, activation='softmax'))

In[10]: model.compile(optimizer='adam', loss='categorical_crossentropy',
   ...:               metrics=['accuracy'])

In[11]: model.fit(predictors, target)
```

Classification

```
Out[11]:
Epoch 1/10

Epoch 10/10
128069/128069 [==============================] - 10s - loss: 0.6531 - acc: 0.6166
```

Let’s practice!

Using models

Using models

- Save
- Reload
- Make predictions

Saving, reloading and using your Model

```
In [1]: from keras.models import load_model

In [2]: model.save('model_file.h5')

In [3]: my_model = load_model('my_model.h5')

In [4]: predictions = my_model.predict(data_to_predict_with)

In [5]: probability_true = predictions[:,1]
```

Verifying model structure

```
In [6]: my_model.summary()
Out[6]:
